Before you trust that customer link

Daniele Mario Areddu · Data Saturday Sofia 2026

DATA SATURDAYS

1 Define the entity

Company, site, contact or application account? Keep local source IDs in separate namespaces.

2 Name the evidence

Use reliable identifiers and relevant independent fields. Missing IDs are missing evidence; a score is not a probability.

3 Check contradictions

Look for conflicting usable IDs and rejected links across the whole group. Similar text alone cannot resolve a contradiction.

4 Choose values by field

Separate identity from survivorship. Define source authority, address roles and effective time; record where each chosen value came from.

5 Keep a route back

Preserve original input, source keys, source time, ingestion time, batch and rule version. Publish the customer-to-source mapping.

6 Give uncertainty an owner

Route uncertain cases to authorised review. Save the evidence and fingerprint. Re-check relevant changes; support correction and split workflows.

7 Measure what improves

Use labelled samples to check false links, missed links and blocking coverage. Track unresolved reviews. A successful run is not proof of quality.

Similar does not always mean the same. Keep the source. Explain the decision.

Companion notebook: source extracts and explicit rules. Validate for your domain.
